

Using the Tufts Thesis Template

This document gives instructions for setting up the L^AT_EX files associated with the PhD dissertation for the Department of Mathematics at Tufts University. We assume you have downloaded the zip file containing all the files needed (Otherwise, how could you possibly be reading this?)

1. Unzip the file into a directory, where you will keep all of your dissertation materials.
2. This will create a folder called TuftsThesisTemplate, which will contain 6 files (including this README) and 2 folders.
 - `matscript.sty`, `mytuftsthesis.cls`, and `siam.bst` are all style and class files needed to generate the thesis in the appropriate format. Please do not edit these unless you know what you are doing. These need to be placed in the same directory as your master tex file or you may also place these in your tex build directory, (`/Users/<username>/Library/texmf/latex/` on a Mac), if you don't want to keep copying these around.
 - `thesis_template.tex` is the master latex file. This is where you will input your name, title, adviser's name, and date. You will also input all the external files, containing your abstract, acknowledgements, bibliography, and chapters of your thesis. The dedication can be input directly in the `\mydedication` section here as well.
 - `thesis_template.pdf` is the pdf output.
 - `contents` is the folder that will contain the individual tex files for the content of your thesis.
 - `abstract.tex` will contain the abstract. This should be kept to 1 page.
 - `acknowledgments.tex` will contain the acknowledgments section.
 - `introduction.tex` and `chapter2.tex` are the first two chapters of your thesis. Feel free to rename these and add more.
 - `refs` will contain your references. Here, they are included as a bibtex file in the `.bib` format. A sample file is provided and the thesis is compiled using an example bibliography style that should conform to the university's formatting policy.
